CUSTOMER QUOTE

“aqua has helped transform our test management process. The seamless Jira integration, traceability, and especially the AI features have not only boosted our team's efficiency but also help elevate the quality of our releases. We're impressed with the value aqua brings to our organization.”

Before

LACK OF TRACEABILITY

Prior to aqua, DigiValet relied on a self-hosted instance of TestLink to manage their testing efforts. As their solutions evolved and the scale of digital platforms increased, the team struggled to keep pace with TestLink's limitations. Manual test case creation, execution tracking, and reporting became significant bottlenecks, particularly as project complexity rose across multiple domains and integrations. The lack of scalability and integration with modern development pipelines left testing siloed from the rest of the product lifecycle, resulting in slower releases and missed opportunities for process improvement.

- ✗ Limited scalability and slow performance with growing test volumes
- ✗ No seamless integration with CI/CD pipelines and modern dev tools
- ✗ Outdated user interface that hampered adoption and efficiency
- ✗ Fragmented test documentation, reducing collaboration and visibility

After

UNIFIED TESTING

Switching to aqua empowered DigiValet to centralize and streamline every aspect of test management. aqua's intuitive interface and robust reporting delivered immediate productivity gains, while enhanced traceability ensured every requirement, test case, and defect was linked for full transparency. Seamless integration with Jira and other development tools facilitated real-time collaboration across QA and development, erasing silos and accelerating delivery cycles. aqua's AI-powered features transformed test case creation—speeding up authoring and automating repetitive steps.

- ✓ Centralized all test cases for consistent, efficient management
- ✓ Seamlessly connected QA and development teams with Jira integration
- ✓ Automated test case generation and reporting with AI features
- ✓ Enhanced visibility and traceability, supporting compliance and faster releases
